COMP 1054 – User Interface Design Using CSS

LAB 2
Underwood №5

DESCRIPTION

Using the HTML and CSS developed during today's lesson, modify several aspects of the typography to come up with your own design.

INSTRUCTIONS

Attempt to complete the following challenges:

- ☐ Change the font-family of all the page headings to *another* font that is also suitable for the subject matter. Try a web-font service like Google Fonts, or pick a web-safer font.
- ☐ Choose *some other* font-family for the paragraph elements – one that is suitable for body copy (good readability) and that *also* includes some *ligatures*.
- ☐ Change the measure (line length) and leading (line-height) of the paragraphs.
- ☐ Adjust the margins and spacing around the page and between textual elements of the document in order to add a bit more white space.
- ☐ There are several instances of duplicated `font-family` declarations – eliminate these duplications by using different types of CSS selectors (like grouped or sibling selectors).
- ☐ Try to get the page working without issues on a small screen width (in portrait orientation) – you will need to adjust some of the typographic settings for the page-level header in particular.
- ☐ Upload your modified page to a server and provide a URL to this Lab, or provide a link to a hosted code repository.
